

Stave Irradiation

- See setup on next page
- Before irradiation
 - IR imaging done with water coolant at 20.6⁰C, flow rate of 1 liter/min, 7.1 W/module
- First irradiation
 - Stave in vessel with nitrogen atmosphere.
 - Module #1(M1) end closest to source
 - Stave in vertical position in ring source
 - Maximum dose is 50 Mrad but varies along stave - how much is TBD.
 - IR imaging done with water coolant at 20.8⁰C, 1 liter/min, 7.1 W/module
 - Before and after images follow
 - Paint quality varies(some bubbles). This affects thermography.
 - Room temperature can vary by up to 2C, which affects measurement
 - Error on comparison measurement around 2C(guess)

Thermography After 2nd Irradiation

- Modules 7-13 only
- Operating conditions
 - Water temperature 20.7C
 - Water flow 1.02 l/min
 - Power per module about 7.0 ± 0.1 W
 - Other modules are masked off except one viewed.
- In the next pages, three thermograms are shown - original(before any irradiation), after 1st irradiation, after 2nd irradiation.
- Order is shown on next page

Before Irradiation

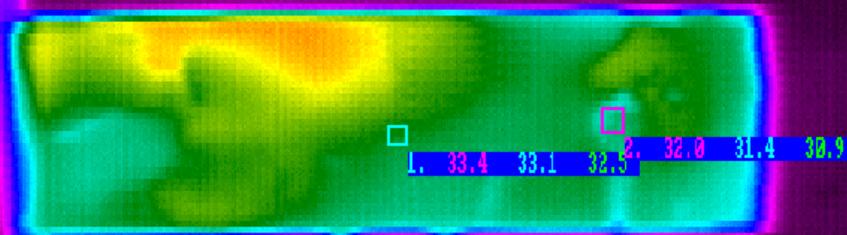

After 1st irradiation

After 2nd irradiation
